

# HI-TECH MOTORSPORTS

If you're a Shelby Cobra enthusiast and your heart's desire is to build a replica reptile that that only its mother could discern from the original, you might do well to check out this entry from Hi-Tech Motorsports. Although it is highly desirable to incorporate some improvements in the original snake (after all, it was designed and manufactured with mid-'60s technology), the Hi-Tech does an exemplary job of disguising the refinements. In fact, you might think of this Cobra replica as a "refined original." For instance, even though the 427SC main frame rails are identical in diameter (4 inches) and design as the original, they benefit from .125" wall thickness for extra torque resistance (the original rails featured 0.095" walls, and were notorious for becoming distorted over time from the stresses of 427 cubic inches of Ford iron torquing its power to the pavement). The remainder of the chassis, including all body braces, the x-braced forward crossmember, the body "birdcage" and even the steering assembly are virtually indistinguishable from the original. Ready for the real Ferrari-stopper? Although the body is available in high-quality, handlaid fiberglass... you can order it in hand-wheeled aluminum (see photographs), just like the original... but with a more rigid body skin than the original could boast. It's also available in your choice 427SC, Competition or 289FIA versions. Although the list of standard equipment is exhaustive, optional items include *Smiths*™ instruments, front-and-rear chrome hoop bumpers, and *Trigo*™ aluminum knock-off wheels... high-quality, precise reproductions of the wheels employed on the original 427 Shelby Cobras. Check it out. For more detailed information, you can order Hi-Tech's product brochure for \$5, or their VHS videotape for \$14.95.
